Title

Sports Database Management System

Group Name

Algoriteam

Problem Statement

To implement a Sports Database Management System, using as many concepts from Data Structures and Algorithms as possible.

Acknowledgement

Firstly, we would like to thank our family and friends, for their constant support throughout out university life.

Moreover, we would like to express our sincere gratitude to the Department of Computer Science, for allowing us to apply our expertise in this assignment, and also for helping us develop the required knowledge to program using the JAVA programming language for this project.

Lastly, our humble and noteworthy appreciation is due to Dr. Pranav Motabhau Pawar for imparting his knowledge. We are thankful his guidance and assistance for the completion of this assignment.

Table of Contents

Introduction

Algorithm

It is a step-by-step procedure to solve a problem in finite time.

Binary Search

Binary search is a fast search algorithm, that works on the principle of divide and conquer. It requires data in the sorted form.

It looks for a particular item by comparing the middle most item of the collection. If a match occurs, then the index of item is returned. If the middle item is greater than the item, then the item is searched in the sub-array to the left of the middle item. Otherwise, the item is searched for in the sub-array to the right of the middle item. This process continues on the sub-array as well until the size of the subarray reduces to zero.

Radix Sort

Tuple-based sorting for multi-dimensional element/record.

Merge Sort

Sorting algorithm that involves the following steps

1. Divide the list
2. Recursively sort the divisions
3. Merge the divisions

Hashing

Hashing is a process of mapping keys and values into a hash table, using a hash function. The efficiency of mapping depends on the efficiency of the hash function used. It is used for accessing data faster, securing data, crytography, generating unique IDs, etc.

Complexity

Run-time complexity refers to the amount of time it takes to run an algorithm. The goal of a program is to maximize the best-case scenario and minimize the worst-case scenario.

The worst-case scenario is measured using order of complexity. The most common notation for representing this order of complexity is Big-Oh notation O.

Some common orders of complexity are

$$O(1) < O(\log n) < O(n) < O(n \log n) < O(n^2 \log n) < O(n^2) < \cdots < O(2^n), O(e^n)$$

Data Structure

It is the organization of data needed to solve the problem.

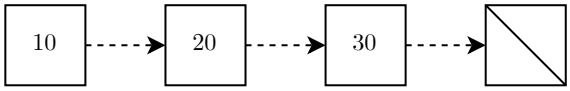
Array

It is a linear data-structure, where data is stored **sequentially**.

10	20	30	40	50
0	1	2	3	4

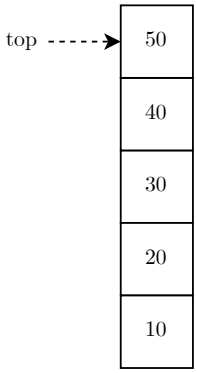
Linked List

A linked list is a linear data structure, in which the elements are **not** stored at contiguous memory locations. In other words, a linked list consists of nodes where each node contains a data field and a reference(link) to the next node in the list.



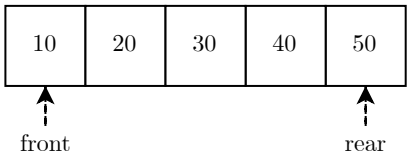
Stack

Stack is a linear data structure in which the operations are performed in LIFO(Last In First Out) order. The elements are visualized to be stored as 'on-top' of each other. They are used in calculator operations, evaluating expressions, and in microprocessors.



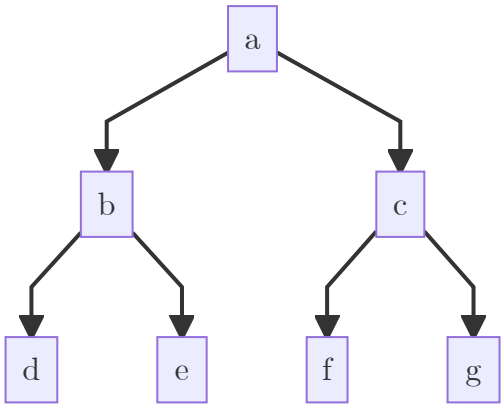
Queue

Stack is a linear data structure in which the operations are performed in LIFO(Last In First Out) order. The elements are visualized to be stored as 'after' each other. They are used in task scheduling, queuing operations, etc.



Tree

It is a non-linear hierarchical data structure, where there is a single root node and every other node contains a parent and/or child. Linear data structures like arrays, stacks, queues, and linked list can be traversed in only one way. But a hierarchical data structure like a tree can be traversed in different ways.



Program

It is the implementation of algorithm in a programming language

This project uses Java programming language for its implementation. Java is a programming language that is used globally to develop various application software.

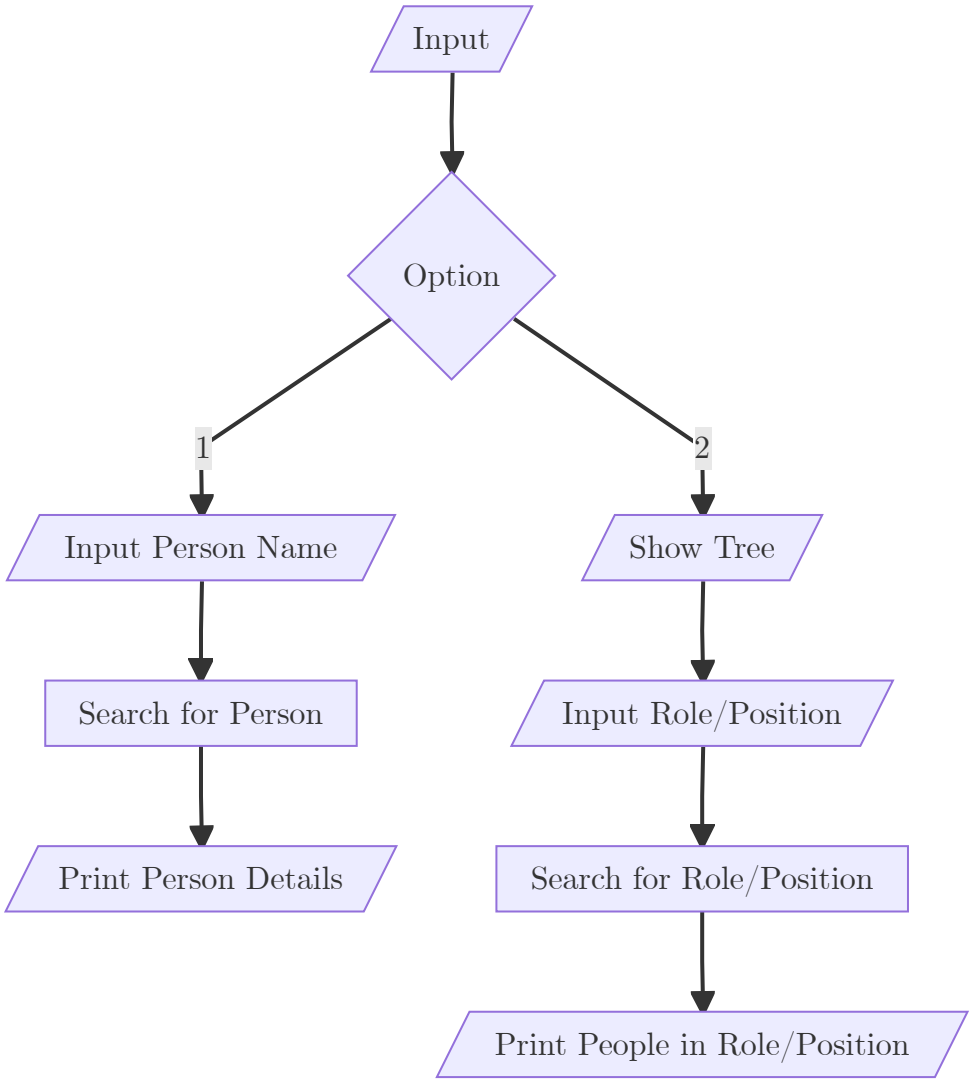
Flowchart



Algorithms

Stack

Algorithm	Complexity
`isEmpty()`	$O(1)$
`isFull()`	$O(1)$
`push(a)`	$O(1)$
`pop(a)`	$O(1)$
`display()`	$O(n)$
`getSize()`	$O(1)$

Algorithm	Complexity
`getStack()`	$O(1)$

```
Algorithm isEmpty():
  if t== -1 Then
      return True
  return False

Algorithm isFull():
  if getSize() == capacity  Then
      return True
  return False

Algorithm push(a):
  INPUT: record a to be inserted into stack
  OUTPUT: stack with newly inserted value and incremented
top
  if isFull()  Then
      return "stack full"
  Else
      t= t+1
      stack[t]= a

Algorithm pop():

  INPUT: None
  OUTPUT: Deleted record from stack
  initialise temporary record r

  if not isEmpty()  Then
      s= stack[t]
      stack[t]=Null
      t= t- 1
  Return s

Algorithm display():

  if not isEmpty()  Then
      for i=0 to i< getSize() Do
          if stack[i] ≠ Null Then
              stack[i].print()

Algorithm getSize():
  Return t + 1

Algorithm getStack():
  Return stack
```

Queue

Algorithm	Complexity
`enqueue(rec)`	$O(1)$
`dequeue(rec)`	$O(1)$
`getQ()`	$O(1)$

```
Algorithm enqueue(rec):
INPUT: Record rec to be inserted into enqueue stack s1
OUTPUT: Stack s1 with new records
    s1.push(rec)

Algorithm dequeue():
    while !s1.isEmpty() do
       r1 = s1.pop();
         s2.push(r1);

Algorithm getQ():
     dequeue()
     Return dequeue stack
```

Searching

Algorithm	Complexity
`binarySearch()`	$O(\log_2 n)$

```
Algorithm binarySearch(name):
  INPUT: id to be searched
  OUTPUT: displays whether record has been found

  radixSort()

  id_no= Hash.hash(name) //fetches hash code for name

  stck= getQ()

  records= stck.getStack()

  right= upperbound(records)
  left= lowerbound(records)
  p=0

  While left⩽right Do
      mid= (left+right)/2

      id_mid= records[mid].getID()

      if id_mid== id_no then
```

```
            p=1
            record found
        Else if id_no> id_mid Do
            left= mid+ 1
        Else
            right= mid-1

        if p==1 then
            display record
        Else
            display name+ " not found"
```

Sorting

Algorithm	Complexity
`getMax(records, len)`	$O(n)$
Merge Sort	$O(n \log_2 n)$

```
Algorithm radixSort():
  INPUT: Unsorted Stack
  OUTPUT: Sorted Stack

  stck= getQ()
  records= getStack()

  len= stck.getSize()
  max= getMax(records, len)

  for e=1 till max/e>0 Do
      sort(records, lowerbound(records) ,
upperbound(records))
      e*=10

 Algorithm merge(arr, l ,m ,r):

  n1=  = m - l + 1
  n2 = r - m

  initialise array L of length n1

  initialise array R of length n2

  for i=0 to i<n1 Do
      L[i]= arr[l + i]
      i= i+1

  for j=0 to j<n2 Do
```

```
        L[j]= arr[1 + m+ j]
        j= j+1

    i=0
    j=0
    k=l

    While i < n1 && j < n2 Do
        if L[i].getID() ≤ L[j].getID() Then
            arr[k] = L[i]
            i= i+1
        Else
            arr[k] = R[j]
            j= j+1
        k= k+ 1

    While i< n1 Do
        arr[k] = L[i]
        i = i + 1
        k= k + 1

    While j< n2 Do
        arr[k] = R[j]
        j = j + 1
        k= k + 1

Algorithm sort(arr, l ,r):
    INPUT: Array arr to be sorted with its upper and
lowerbounds
    OUTPUT: sorted array arr
    if l< r then
        m= l + (r-l)/ 2
        sort(arr, l, m)
        sort(arr, m + 1, r)
        merge(arr, l, m, r)

Algorithm getMax(r, len):
    INPUT: Array r of length len
    OUTPUT: Maximum value present in array r based on ID
number

    max= r[0].getID()

    for i=1 to i< len Do
        if max< r[i].getID() Then
            max= r[i].getID()
    Return max
```

Hashing

Algorithm	Complexity
`hash()`	$O(n)$

```
Algorithm hash()
  INPUT name
  OUTPUT hashed sum

  sum ← 0

  toTitleCase(name) // ensure case-insensitivity

  a ← 10
  for i←0 to name→length
    sum += Math.pow(a, i) * name.charAt(i) // a^n * char

  return sum
```

Tree

Algorithm	Complexity
`search(t, str)`	$O(1)$, as the number of categories will be finite (no more than 10 or so)
`traverse(t, str, root, out)`	$O(n)$
`join(m, t)`	$O(1)$

Time complexity of the tree increases as the height h of the tree increases - $O(h)$. So, to reduce the worst-case complexity of the program for the given number of vertices (entered by user), tree must structured in a way that the height is minimum - ensuring that $O(h)$ can be the least.

```
Algorithm Search(t,str)
  if(str=t.s)
    return t
  c ← 0
  while(t.child[c]≠null)
    x ← Search(t.child[c],str)
    if(x=null IS NOT TRUE)
      return x
    c←c+1
  return null

Algorithm traverse(t, str, root, out)
  if(t=root IS NOT TRUE)
```

```
      if(t.p=10)
        out←out+"\n"+ str+"├──"+t.s
      else
        out←out+"\n"+ str+"└──"+t.s
      if(t.p=10)
        str←str+("│   ")
      else
        str← str+("    ")
  else
    out←t.s
  c ← 0
  while(t.child[c]=null IS NOT TRUE)
    out← traverse(t.child[c],str,root,out)
    c←c+1
  return out

Algorithm join(m, t)
  if(m.x > -1)
    m.child[m.x].p←10
  m.x←m.x+1
  m.child[m.x]←new Tree(t);
  if(m.x=0)
    m.child[m.x].p←0
  else
    m.child[m.x].p←1

Algorithm main()
  in ← "data.csv"
  sc = new Scanner(new File(in))
  Root ← new Tree("Football")

  while(sc.hasNext())
    line ← sc.nextLine()
    line ← line.toLowerCase().replaceAll(" ","")
    i2 ← line.lastIndexOf(',')
    r ← line.substring(0,i2)
    t ← line.substring(i2+1)
    if(Search(Root,t)=null)
      join(Root,t)

    m ← Search(Root,t)
    i1 ← r.lastIndexOf(',')
    u ← r.substring(0,i1)
    v ← r.substring(i1+1)
    if(Search(Root,v)=null)
      join(m,v)

    i ← u.indexOf(',')
    u←u.substring(0,i)
    z ← m.child[m.x]
```

```
    join(z,u)

  output ← traverse(Root,"",Root,"")
  Display output

  Display ("Enter Role/Position to be searched")
  ACCEPT r
  if(Search(Root,r)=null)
    Display("Not Found!")
  else
    tr ← Search(Root,r)
    if(tr.child[0]=null)
      Display(r+" is a name!")
    else if(tr=Root)
      Display (r+" is the root!")
    else
      output ← traverse(tr,"",tr,"")
      Display (output)
```

Conclusion

Using JAVA we were able to connect and apply the knowledge we learned in Data Structures and Algorithms. We learned that programming can be used to solve real life problems.

During this assignment, a new concept we learned was that we could use the gui and using various data structures to make a database portal. Our project provides a very efficient service to the users, and its system is well-planned and organized for anyone to run it smoothly. This system can be used to store and access players details. Overall, this was an excellent application activity and benefit to our learning experience.

We have built this project with the skill and knowledge of the following concepts.

DSA

- [x] Arrays
- [x] Stacks
- [x] Queues
- [x] Hashing - Polynomial
- [x] Sorting - Radix Sort
- [x] Sorting - Merge Sort
- [x] Searching - Binary Search
- [x] Trees
- [x] Linked List (Tree Implementation)
- [x] Searching - Binary Tree Search

Miscelaneous

- [x] Classes
- [x] Objects
- [x] File Handling
- [x] Exceptions and Exception Handling
- [x] GUI
